

Fax Server

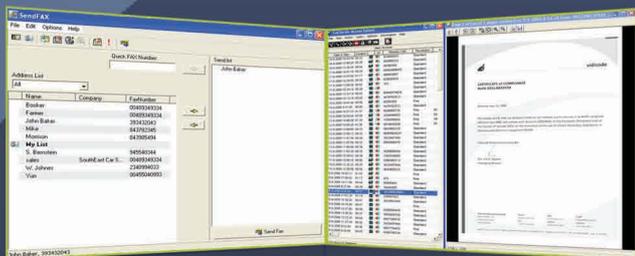

Suppose money
would grow on trees

Save time, money and the environment with a Fax Server

Vidicode Fax-Servers take the paper out of faxing and reduce the handling time to zero, making them cost effective. Receive and send your faxes from the PC on your desk via the regular fax number, and automatically store all fax traffic in a digital archive. Received faxes can be automatically rerouted to specific E-mail addresses. Sending of faxes can be integrated in a document preparation environment or can be done with intuitive client software. With the "File-to-Fax" tool it is also possible to automatically generate and send faxes such as reminders, bills, laboratory results, recipes etc. Thousands of faxes can be stored in a database for an unlimited period, without loss of paper and information, and can be retrieved quickly using effective database search routines from behind your desk (the included FS access software).

Your faxes are serious business, faxes you send out need to be sent quickly, faxes you receive can be orders that need to be fulfilled today! Fax-Servers based on stand-alone hardware designed for only one purpose are easy to implement, reliable and provide 24/365 up-time, making sure your communication does not falter.

Since Fax-Servers need to be switched on permanently, Vidicode has designed its Fax-Servers to have an extremely low power consumption (7-15 W model dependent) compared to other solutions, saving hundreds of Euro's per year. The low power consumption combined with the man-hours saved in the handling with paper fax-machines, the reduction in use of paper, toner and the minimal maintenance requirements, provide for a quick ROI on a Vidicode Fax-Server.

Blue Line Fax Server UNO | IP | PRI | ISDN II |

Fax Servers:

Fax server UNO | IP

Although internally very sophisticated, the Fax Servers Uno and IP are delightfully user friendly. It requires no maintenance, no integration with exchange and takes up no licenses on the network. The Fax Servers Uno and IP are single line units that need to be connected to an analogue internal extension or an external analogue line. The Fax Servers send and receive faxes from your PC via LAN. They are the ideal cost effective solution for an average sized organisation which might send and/or receive anything from 10 to 200 faxes per day.

Fax server ISDN II

This Fax Server is usually connected directly to the ISDN basic rate trunk line(s) completely independent of the telephone switch (PBX). Besides the normal Fax Server functionality this Fax Server can be used to redirect incoming faxes automatically. With Automatic inbound fax routing users can be assigned personal fax numbers without having to install physical fax lines for each number. The number of the line is passed to the Fax Server upon receiving the fax, and it will automatically reroute the fax to the corresponding user. "Unified messaging" at its best.

Fax server Octo | Quarto

The Octo and Quarto models are multi line analogue fax servers. Depending on your organisations needs you can decide how many active fax channels you want installed in the unit. Minimum is 1, maximum is 4 or 8 depending on the Fax Server's model. The number of active fax channels dictates how many faxes you can send and/or receive at the same time.

Fax server PRI

The Fax Server PRI is a true corporate Fax Server for the demanding customer. To give an idea of the capacity of the PRI, with the "File-to-Fax" tool it can send or receive up to 23.000 single page faxes per day. The PRI is usually connected directly to the trunk line. It is a 19" rack (2U) with a maximum of 16 channels. Like all Fax Servers the Fax Server PRI is supplied with an unlimited software license, it does not matter whether you use the Fax Server with 10 people or 100. This means...no hidden costs afterwards.
